

**CALIFORNIA STATE SCIENCE FAIR  
2002 PROJECT SUMMARY**

<b>Name(s)</b> Rebecca J. Olson	<b>Project Number</b>  22346
<b>Project Title</b> Properties of the Pendulum	
<p style="text-align: center;"><b>Abstract</b></p> <p><b>Objectives/Goals</b> My objective was to find which variable - weight, length, or amplitude - would have the greatest effect on the period of a pendulum. I believed that weight, length, and amplitude would each have an equal effect on the period.</p> <p><b>Methods/Materials</b> I constructed a pendulum to test different weights, lengths, and amplitudes to see which would have the greatest effect on the period of the pendulum. I then tested three different lengths, 30 cm, 60 cm, and 90 cm; three different amplitudes, 20°, 45°, and 70°; and three different weights, 1-1/4 oz, 2-1/2 oz, and 3-3/4 oz. I timed each of these variables 10 times for one period of motion.</p> <p><b>Results</b> I found that length made the most significant difference in time. Weight and amplitude made little or no difference.</p> <p><b>Conclusions/Discussion</b> My hypothesis was not supported. I found that length made the most significant difference in time.</p>	
<b>Summary Statement</b> To determine what affects the period of a pendulum -- weight, length, or amplitude.	
<b>Help Received</b> Father used power tools to cut pendulum materials to size and helped with the assembly of pendulum.
