

**CALIFORNIA STATE SCIENCE FAIR
2002 PROJECT SUMMARY**

Name(s) Andrew M. Hernandez	Project Number 22560
Project Title Are Expensive Paintballs More Accurate?	
<p style="text-align: center;">Abstract</p> <p>Objectives/Goals My project is to find out if the expense of a paintball matters in their accuracy. I believe that the more expensive paintballs are in fact less accurate then the non expensive paintballs.</p> <p>Methods/Materials I took one paintball gun and checked its velocity to make sure that the velocity would not change. Then I put the gun in a stationery stand and fired two types of paintballs at the target, expensive paintballs and non expensive paintballs. Then from the accuracy of the paintball I determined if the more expensive paintballs were more acurate or not.</p> <p>Results The expensive paintballs were not accurate, while the non expensive paintballs were accurate.</p> <p>Conclusions/Discussion In conclusion, I found out that expensive paintballs are not more accurate then non expensive paintballs but they are in fact less accurate.</p>	
Summary Statement My project is about the accuracy of a paintball determined by its price.	
Help Received My science teacher helped me with my procedure and my background Information.
