Project Title	
Battle for the Blind: Is the Mobility Glove More Effective Than the	
White Cane?	
Abstract	
<b>Objectives/Goals</b> The objective is to invent a glove using ultrasonic sensors and vibration	on modules that is more effective to
assist mobility in blind people than the typical white cane	$\sim$
Methods/Materials 5 blindfolded volunteers went through an obstacle course 10 times of	time using the mobility glove and 5
5 blindfolded volunteers went through an obstacle course 10 times it times using the white cane. They were each timed and were recorded	on how many times they bumped
into objects.	
<b>Results</b> On average, participants completed the course from 5-10 seconds fast	er using the mobility glove, but ran
into less objects while using the white cane.	
Conclusions/Discussion	nor 2 dimensional idea of their
Overall, the mobility glove is a helpful invention for the blind to get a surroundings, and might be the next step forward in blind assistive to	chnology. The next invention I am
surroundings, and might be the next step forward in blind assistive to working in is a pair of kneepads that uses this technology at a lower v	antage point so things such as steps
can be sensed.	
$\sim$ $\checkmark$	
Summary Statement	
I invented a mobility glove that uses an ultrasonic sensor and tested it	in a controlled environment against
a white cane.
