

CALIFORNIA STATE SCIENCE FAIR 2015 PROJECT SUMMARY

Name(s)	Project Number
Daniel A. Miret	
	35300
Project Title	
Extras in Your Raw Vegetables	
	$ \times \times 7 $
Abstract	
Objectives/Goals	
My Science project was about what vegetable is safer to eat raw the ones dome	sically produced here in
the U.S.A or of the same type but imported from Mexico. I based my interest of	Nathaniel Simms that
imported products are as safe as homeland products because they go through te	sts to guarantee that they
are safe to eat. I believe that imported raw products from Mexico sontain more	sontaminants than those
produced in homeland U.S.A.	
	following: Potri dish
Materials used to find and help understand my conclusion and results are in the swabs, bowl with cold water, incubator, microscope, gloves transparent graph	that measures squared
centimeter per square. My procedure started in my school's science lab, first I p	repared the vegetables.
Beets, Cilantro, Asparagus, Green Onion, Green Squash, both imported or hom	eland by washing each in a
separate bowls. Then I used a sterile swab to collect supples from the contamin	ated water next I
inoculated the agar with the contaminated water sample, after repeated my pro-	ocedure from steps 3-6.
later observed growth on the petri dishes and after took the samples and did a w	vet mount and examined it
even closer.	
Results NL X7	
The results indicated that Mexico#s regetables were contaminated more than U	SA#s (shown on the
The results indicated that Mexico#s vegetables were contaminated more than USA#s (shown on the graphs) the average bacteria grown on Mexico#s vegetables was a total of 14.97 yellow bacteria and 4.44 purple bacteria and together a total of 19.41. For USA#s was 6.57 yellow bacteria and 7.113 purple	
purple bacteria and together a total of 19.41. For USA#5 was 6.57 yellow bacte	ria and 7.113 purple
bacteria and together a total of 13.683.	
Conclusions/Discussion	. 11
From the results of the colony counts and identification of microorganisms, those raw vegetables produced in Mexico has about 20% more bacteria than U.S.A.#s vegetables. Regardless of whether the	
produced in Mexico has about 20% more bacted anan U.S.A.#s vegetables. Regardless of whether the	
products are produced in U.S.A or imported from other countries, it is still safer to wash as much as possible to clean off any contaminated particles grown on your vegetables by using sprays sold at stores for example Fruit & Vegetable Wash or you could use boiling water or the old fashion, water.	
for example Fruit & Vegetable Wash or you could use boiling water or the old	fashion water
Tor example i fuit de vegetable wan of yet could use bonning water of the old	tasmon, water.
Summary Statement	
My project is about what vegetable is safer to eat raw the ones domestically pro	duced here in the U.S.A or
of the same type but imported from Mexico	
Help Received	
Dad And Mom helped in taking me to get my materials and always were there	when needed special help:
Mrs. Urbiztondo my teacher who helped me in my procedure	1 · · · · · · · · · · · · · · · · · · ·
